BUSINESS INTELLIGENCE (BM234)

INTEGRAL BUSINESS SCHOOL

UNDERSTANDING RESTAURANT BUSINESS THROUGH DATA

The restaurant industry generates large amounts of information, including customer ratings, restaurant locations, cuisines, pricing and delivery preferences.

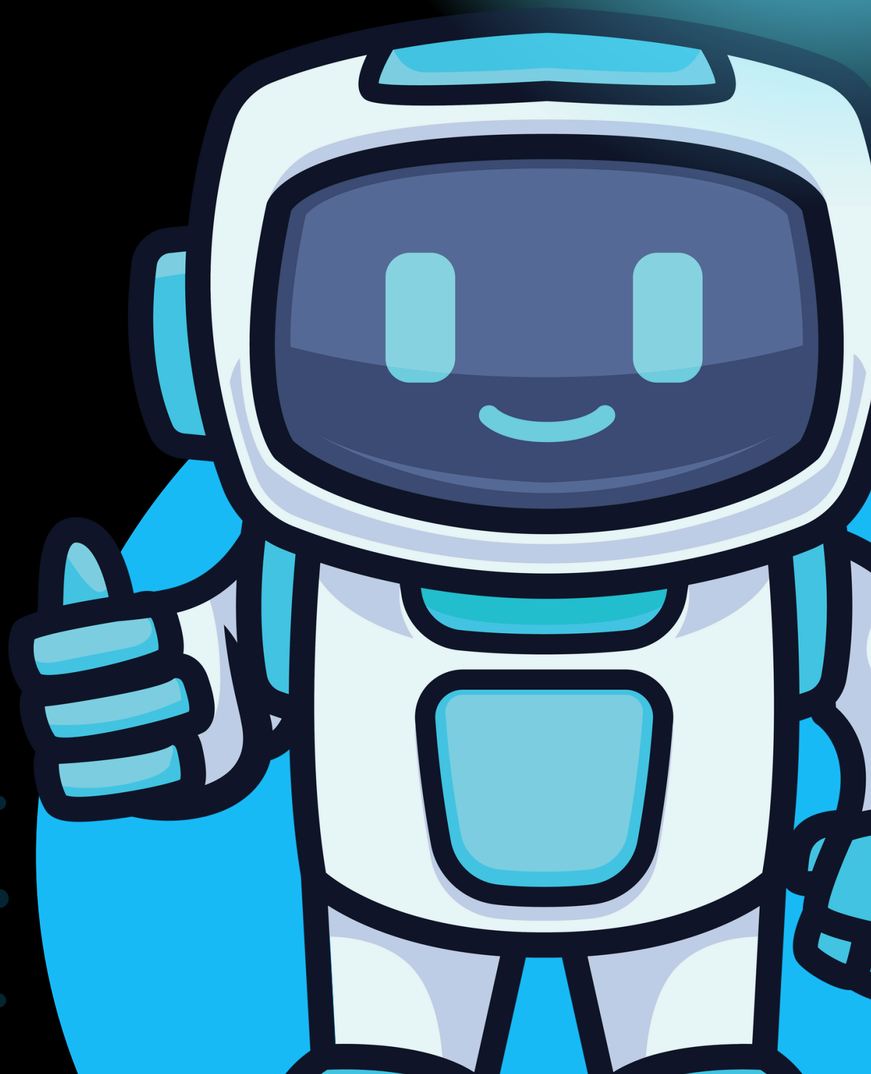

Business Intelligence helps transform this raw information into meaningful insights that support better business decisions.

Our Project Focus:

- Analyse restaurant data across 10 Indian cities.
- Understand customer ratings and preferences.
- Identify popular cuisines and restaurant categories.
- Study pricing and online delivery patterns.
- Create interactive visualisations using Power BI.
- Use SQL to extract meaningful business information.

Business Question:

How can restaurant data help businesses understand their market and improve decision-making?

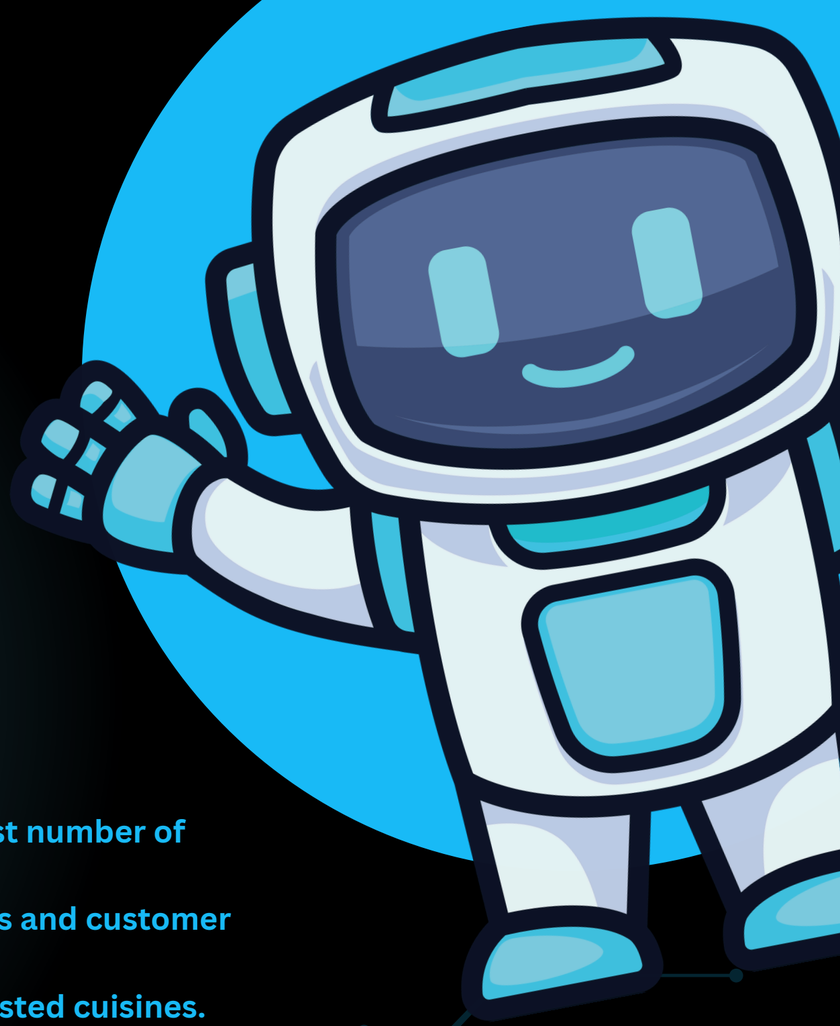

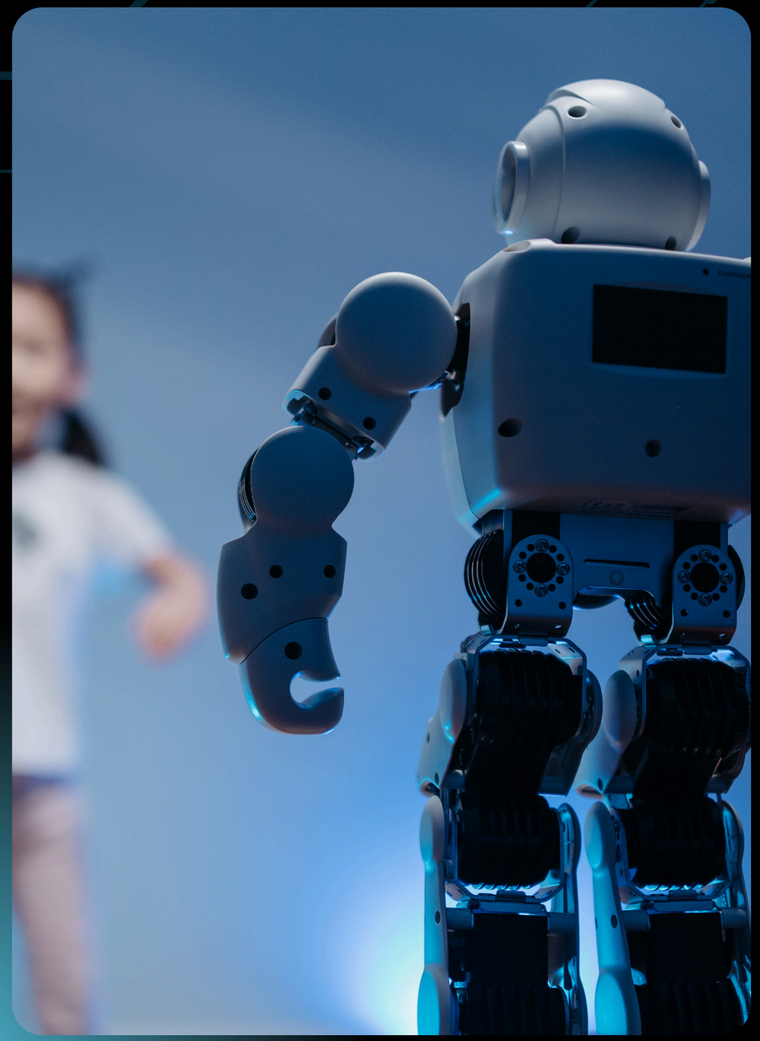

WHAT ARE WE TRYING TO ACHIEVE ?

1. Market Analysis: Identify cities with the highest number of restaurant listings.
2. Customer Analysis: Understand restaurant ratings and customer engagement.
3. Cuisine Analysis: Identify the most frequently listed cuisines.
4. Pricing Analysis: Compare budget, mid-range, premium and luxury restaurants.
5. Delivery Analysis: Examine online delivery availability.
6. Data Visualisation: Present findings through Power BI dashboards.

Expected Outcome:

Convert raw restaurant records into understandable business insights that can support strategic planning.

GETTiNG FAMiLiAR WiTH OUR DATA

Our project uses an Excel dataset containing 1,000 restaurant records and 13 columns.

Category
Information Available
Restaurant Details
Restaurant ID, Name
Location
City, Locality
Food Information
Primary Cuisine, Restaurant Type
Customer Feedback
Aggregate Rating, Rating Category,
Votes
Pricing
Average Cost for Two, Price Category
Services
Online Delivery, Table Booking

Dataset Coverage:

- Total restaurant records: 1,000
- Cities covered: 10
- Unique cuisines: 16
- Restaurant types: 7
- Rated restaurants: 951
- Restaurants without ratings: 49

DATA CLEANING & PREPARATION

Preparing Data for Accurate Analysis
Before creating visualisations, data needs to be checked and prepared.

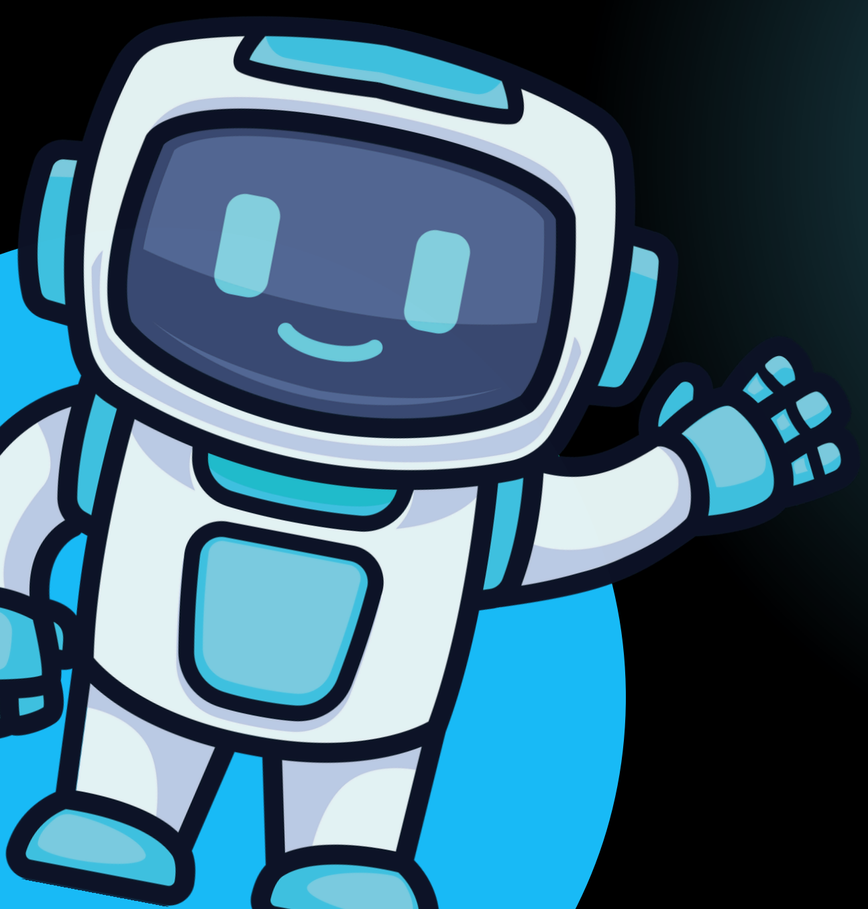

Check	Result
Total records	1,000
Duplicate Restaurant IDs	0
Missing restaurant IDs	0
Missing city values	0
Missing cuisine values	0
Missing ratings	49

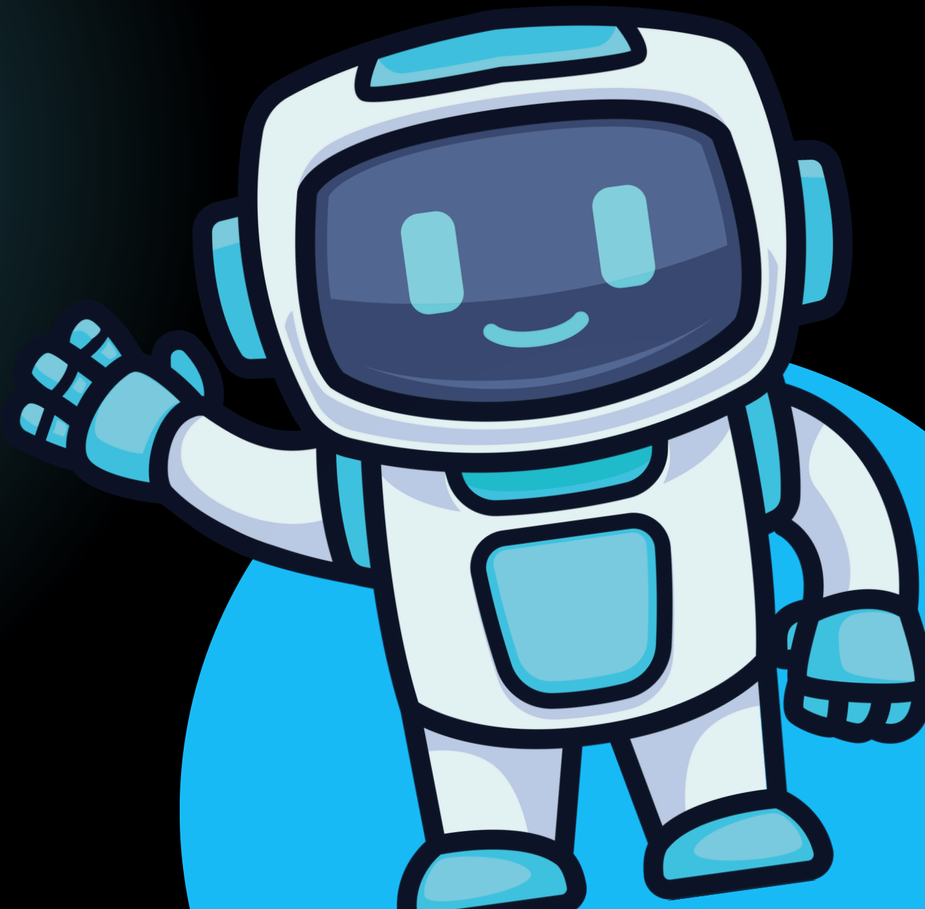

SQL ANALYSIS

Query 1: Find the number of restaurants in each city.

```
SELECT
City,
COUNT(*) AS Total_Restaurants
FROM Restaurant_Data
GROUP BY City
ORDER BY Total_Restaurants DESC;
```

Query 2: Find the most popular cuisines by listing count.

```
SELECT
Primary_Cuisine,
COUNT(*) AS Cuisine_Count
FROM Restaurant_Data
GROUP BY Primary_Cuisine
ORDER BY Cuisine_Count DESC;
```

QUERY 3: CALCULATE THE AVERAGE RESTAURANT RATING.

```
SELECT

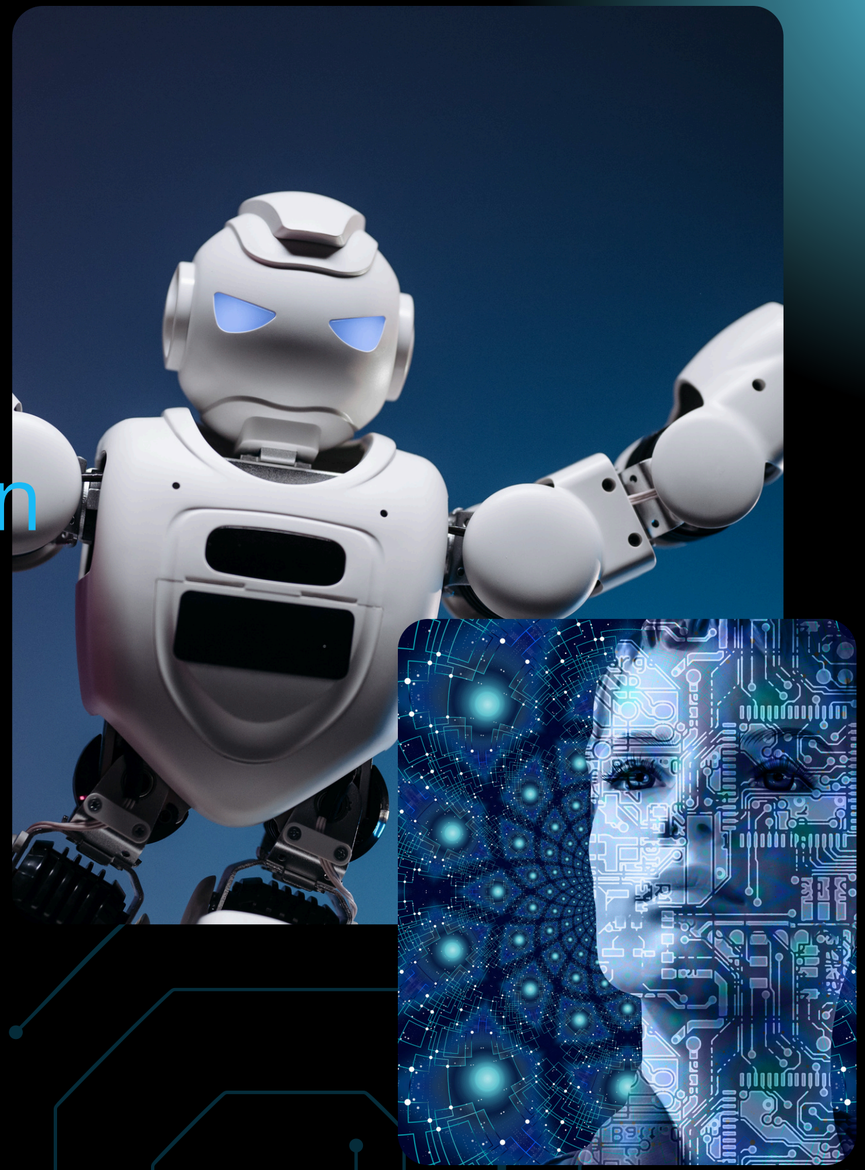

AVG(Aggregate_Ra
ting) AS
Average_Rating
FROM
Restaurant_Data;
```

Query 4: Analyse online delivery availability.

```
SELECT
Online_Delivery,
COUNT(*) AS
Total_Restaurants
FROM Restaurant_Data
GROUP BY Online_Delivery;
```

POWER BI DASHBOARD

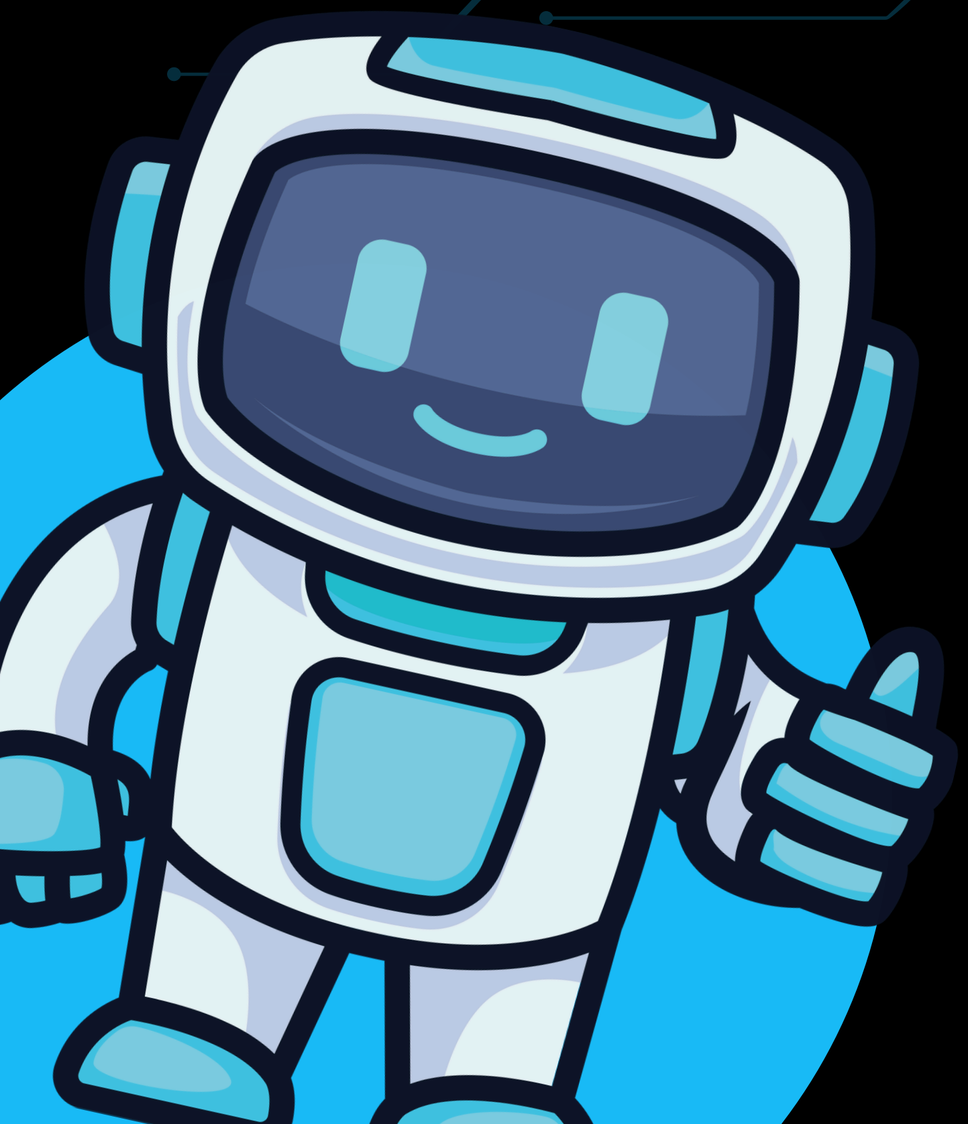

Our Proposed Dashboard Design

Top KPI Cards:

Dashboard Visualisations:

1. Restaurants by City – Bar Chart.
2. Cuisine Distribution – Column Chart.
3. Rating Distribution – Donut Chart.
4. Price Category – Pie Chart.

KEY FINDINGS & CONCLUSION

Major Findings:

1. Kolkata has the highest restaurant count, with 118 listings.
2. Mughlai is the most frequently listed cuisine, with 77 listings.
3. The average restaurant rating is approximately 3.93.
4. Mid-range restaurants dominate the pricing distribution.
5. 648 restaurants offer online delivery.
6. Casual Dining is the most common restaurant type.

Business Recommendations:

- Restaurants can study city-level competition before expansion.
- Businesses can analyse customer ratings to identify improvement opportunities.
- Pricing strategies can be evaluated using restaurant categories.
- Delivery availability can help businesses understand service coverage.

THANK YOU

Turning Data into Decisions.
